Description of SAFIR®

- SAFIR is a computer program that models the behavior of building structures subjected to fire.
- The structure can be made of a 3D skeleton of linear elements such as beams and columns, in conjunction with planar elements such as slabs and walls. Volumetric elements can be used for analysis of details in the structure such as connections.
- Different materials such as steel, concrete, timber, aluminum, gypsum or thermally insulating products can be used separately or in combination in the model.
- It is used for research and for commercial applications.
Description of SAFIR®

The numerical analyses are based on the nonlinear finite element method.

- 2D or 3D conductive elements for thermal calculations
- Linear elements for modeling beams, columns (Bernoulli beam type)
- Plane elements for modeling slabs, walls, steel plates (shell type)
- 3D volume F.E. for modeling connection details, massive members (3D solid type)
1) Introduction to SAFIR
   a. Description of the software
   b. **3 steps procedure: fire, thermal, mechanical**
   c. Selection of Finite Element type for thermal-mechanical analysis
   d. Description of the available FE
   e. General principle of a thermal-mechanical analysis with beams
   f. List of available materials

2) Introduction to the software environment

3) Examples, validation, and user community

4) Resources
3 steps procedure in a SAFIR analysis

1. The thermal attack from the fire is given as an input data

2. SAFIR computes the evolution of temperature in the sections (thermal analysis)

3. SAFIR computes the mechanical behavior of the structure at elevated temperatures, taking into account the thermal elongation as well as the reduction of strength and stiffness in the materials (mechanical analysis)
3 steps procedure in a SAFIR analysis

Example: numerical simulation of the FICEB full-scale fire test

Step 1: Define the fire

- The thermal action produced by the fire is given as an **input** data by SAFIR.
- The thermal action can be represented by **various methods** (see “thermal” course):
  - Time-temperature curve (standard fires or user-defined curves)
  - Imposed flux
  - Local model from a local fire to a beam or ceiling (Annex C of EN 1991-1-2)
  - Local model from a local fire to a column (RFCS project “LOCAFI”)
  - Environment calculated from a CFD software (e.g., FDS)
Step 2: Thermal analysis

SAFIR performs the transient thermal analysis to determine the **temperature distributions** in the structure

- 2D or 3D thermal calculations
- Finite elements: triangular, quadrangular, prismatic (6 or 8 nodes)
- Predefined thermal material models from Eurocodes: concrete, steel, wood, aluminum, gypsum
- User materials with user-defined temperature-dependent thermal properties
Step 3: Mechanical analysis

- SAFIR performs the transient mechanical analysis to determine the response of the structure (displacements) under increasing temperatures
- It takes into account the effects of thermal expansion and material degradation
  - 2D or 3D structural calculations
  - Finite elements: truss, beams, shell, solid, spring
  - Nonlinear mechanical properties that are temperature dependent
  - Large displacements
  - Predefined material models of Eurocodes: concrete, steel, wood, aluminum
  - Gives result as a function of time: displacements of the nodes, support reactions, stresses, tangent modulus, effects of actions (M, N, V), etc.
- SAFIR also calculates the torsional stiffness of the section (LTB check)
1) Introduction to SAFIR
   a. Description of the software
   b. 3 steps procedure: fire, thermal, mechanical
   c. Selection of Finite Element type for thermal-mechanical analysis
   d. Description of the available FE
   e. General principle of a thermal-mechanical analysis with beams
   f. List of available materials

2) Introduction to the software environment

3) Examples, validation, and user community

4) Resources
Types of Finite Elements

- Link between thermal and mechanical analyses

The type of model used for the thermal analysis depends on the type of model that will be used in the subsequent mechanical analysis.

Transfer of temperature information in mechanical finite elements

- For **3D solid elements**, the same discretization is used for the thermal and mechanical analyses so that the temperatures are directly mapped on the mechanical model.
Transfer of temperature information in mechanical finite elements

- For **beam elements**, the discretization of the section employed for the thermal analysis (calculation of the temperature at each node) is used in the form of **fibers** for the beam elements in the mechanical analysis. Thus, the determination of forces and stiffness in the section is based on the **temperatures in each element used in the thermal analysis which form a fiber** in the beam element.
Transfer of temperature information in mechanical finite elements

- For shell elements, a uniaxial temperature distribution is calculated across the thickness of the slab using pseudo-2D conductive finite elements. The temperature at the through thickness points of integration for the mechanical analysis is linearly interpolated between the nodal temperatures.
1) Introduction to SAFIR
   a. Description of the software
   b. 3 steps procedure: fire, thermal, mechanical
   c. Selection of Finite Element type for thermal-mechanical analysis
   d. **Description of the available FE**
      e. General principle of a thermal-mechanical analysis with beams
      f. List of available materials

2) Introduction to the software environment

3) Examples, validation, and user community

4) Resources
Discretization for mechanical analysis

- **Truss**
- **Beam**
- **Solid**
- **Shell**
Truss FE

- One single point of integration (i.e. one material, temperature and stress level) for each element
- 3 DoF at the two end nodes (translations)
- Cannot represent buckling
- Use:
  - External prestressing tendons
  - Individual rebars in 3D solid elements
  - Bar in tension in a structure (e.g. bracing bar in a building)
  - To create a linear relationship between two nodes
Beam FE

- Prismatic straight Bernoulli type element
- 7 DoF at the two end nodes: translations, rotations, warping
- 1 DoF at the central node to bear the nonlinear part of the axial displacement
- Integration on the section is based on a fiber model
- Longitudinal integration is performed numerically using 2 or 3 points of Gauss
- Warping function and torsion stiffness calculated based on thermal analysis discretization
- Use:
  - Linear members: beams, columns
  - Bars in truss girders (to capture buckling)
  - Steel studs in composite steel-concrete members
  - Semi-rigid connections (taking advantage of fiber model)
Shell FE

- Quadrangle based on 4 nodes
- 6 DoF at each node: 3 translations and 3 rotations
- Integration on the plane is performed numerically using 4 points of Gauss
- Integration on the thickness is performed numerically with the user choosing the number of Gauss points (from 2 if membrane behavior dominates to 10 if bending dominates)
- Possibility to embed layers of reinforcement (smeared laterally, uniaxial behavior)
- Use:
  - Planar members: slabs, walls
  - Plates of steel members (to capture local buckling)
Solid FE

- Based on 6 or 8 nodes
- 3 DoF at each node (translations)
- The user can select from 1 to 3 Gauss integration points in each direction
- Only the quasi-static procedure is available, large displacements not taken into account
- Use:
  - Joints
  - Hollow core slabs
  - Concrete masses
Spring FE

- One single node (pertaining to the structure) and one direction
- Its behavior is directly described by a force-displacement relationship (no material)
- Use:
  - To link the structure to the external world via a non-linear relationship
  - Soil pressure on the walls and under the foundations of tunnels
  - Soil pressure on vertical walls of underground car parks
1) Introduction to SAFIR
   a. Description of the software
   b. 3 steps procedure: fire, thermal, mechanical
   c. Selection of Finite Element type for thermal-mechanical analysis
   d. Description of the available FE
   e. **General principle of a thermal-mechanical analysis with beams**
   f. List of available materials

2) Introduction to the software environment

3) Examples, validation, and user community

4) Resources
General principle of a mechanical analysis based on beam FE (1/2)

1. Place some nodes in the global system of coordinates
2. Link them with beam elements
3. Define the geometry of the section(s)
4. Calculate the temperatures in the section(s)
General principle of a mechanical analysis based on beam FE (2/2)

5. Link the section(s) with the elements

6. Define supports and loads

7. Let the heating go

Preprocessor GmSAFIR

- GmSAFIR is a GUI preprocessor
- Allows the generation of input files for 2D / 3D, thermal / torsional / structural models
- GmSAFIR is free and open source, see: https://github.com/gmsafir/gmsafir

Note: use of GmSAFIR is not strictly necessary – SAFIR reads ASCII input files which can be generated by text editor, user-developed code, etc.

Post-processor DIAMOND

- DIAMOND allows visualizing the structure and the results
- Allows plotting charts for many results and exporting them to Excel
- DIAMOND is developed by the SAFIR team and can be obtained for free at: https://www.uee.uliege.be/cms/c_4016387/fr/ueenew-ressources-sur-safir
Organization of the files for a typical calculation – Example for:

- One mechanical calculation for a structure made of beam elements
- In which there are 2 different section types

Note: one new section type must be considered if:

- the geometry of the section is different,
- the fire curve is different,
- the thermal properties are different,
- the mechanical properties are different.

Note: in this latter case, it is possible to copy the results of the thermal calculation in a file with a new name.
1) Introduction to SAFIR
   a. Description of the software
   b. 3 steps procedure: fire, thermal, mechanical
   c. Selection of Finite Element type for thermal-mechanical analysis
   d. Description of the available FE
   e. General principle of a thermal-mechanical analysis with beams
   f. List of available materials

2) Introduction to the software environment

3) Examples, validation, and user community

4) Resources
Examples of thermal analysis

2D thermal calculation - Reinforced concrete column with hollow core
1097 nodes - 2012 triangular elements

Temperature evolution in the RC section

3D thermal calculation
H-section through a slab

2D thermal calculation – Steel section
Interfacing with FDS simulation (localized fire)
Example of mechanical analysis

Steel-concrete building by R. Fike and V. Kodur
Michigan State University, USA
Partial model of an eight story steel frame office building

Example of mechanical analysis of a full scale test

3D mechanical calculation – Steel frame

Flumilog test, INERIS, France
2 624 nodes, 940 beam elements
Example of mechanical analysis of a full scale test

Vassart et al., RFCS project FICEB – *Modeling of a full-scale tensile membrane fire test*

Validation

  - Open data: http://hdl.handle.net/2268/208197

- The full report is at https://www.uee.uliege.be/cms/c_4016387/fr/ueenew-ressources-sur-safir
SAFIR®

in the world

Non linear finite element software for structures in fire

+250 licenses sold
43 countries
5 continents
